Bulb Size

Bolting Resistance

- Highly palatable leafy forage
- Hardiness gives more reliable January, February grazing than Stubble Turnips

Available with specialist seed treatment to help protect against flea beetle attack

Flea Beetle treated seed must be drilled and not broadcast as it can be toxic to people and wildlife. Also, if left on the soil surface, the effectiveness of the chemical will be reduced

Care should be taken when changing an animal's diet from grass to high protein brassicas (especially in Summer). If you are unfamiliar with the utilisation of these crops, we would ask you to read our guidelines on the subject and these are available on request.
